

NAME: BAVESH P

REGISTRATION NUMBER: 25BAI10093

DEGREE: BTECH

BRANCH: CSE(AIML)

YEAR: 2025-2029

COURSE: DIGITAL LITERACY

COURSE CODE: CSE0001

DATE: 28/03/2026

Introduction :

As a first-year B.Tech in AI & Machine Learning, I have come to understand that "being good at computers" doesn't necessarily mean "being digitally literate." This course has been a reality check for me, taking my interest in technology from consumption to creation, where my professional self is defined by my online presence. Within these five modules, I have been working with everything from visual design to cloud collaboration, to the ethical considerations of my "digital footprint." This report represents my exploration of the tools, the challenges, and the opportunities in becoming a member of the tech industry.

Task 1: Digital Literacy Awareness Infographic:

For my first task, I decided to use Prezi to create an infographic for my classmates. I decided to focus on three key areas. The areas include how to stay safe online, how to effectively use various productivity tools, and how to be polite when using email. I decided on a high-contrast infographic with a 16:9 format so it looked good on my laptop screen.

The part I found hardest was probably not Prezi itself, but understanding the concept of "information hierarchy." I have so much information regarding cybersecurity, and it was hard to reduce it to just a handful of "actionable tips" without making it look messy. I learned how to stop adding information and let it speak for itself. I learned that digital literacy is not just knowing your stuff; it's also knowing how to effectively communicate it.

Task 2: Building My Student Digital Portfolio :

The task was all about "planting my flag" online. I created and perfected profiles for GitHub, LinkedIn, and Kaggle. For GitHub, I didn't just create a profile; I created a customized "profile README" using Markdown that will be a landing page for all of my code and academic interests in AIML. LinkedIn is my central location for networking. Kaggle is where I will monitor all of my progress in data science competitions.

I envision these sites as a four-year history of my growth and development. GitHub is essentially my digital diary for version control that future employers can look at and see how consistent I've been. LinkedIn is how I transition from the classroom to the working world. By doing this at this early stage in my first year of college, I'm making it so that it's a lot easier for myself in a few years when it's time to start looking for internships.

Task 3: Coding and Cloud Collaboration :

This task was an interesting mix of logic and collaboration. The coding part involved me getting onto HackerRank and completing the "Solve Me First" challenge. It was a good exercise in getting familiar with how competitive coding sites handle Python inputs and outputs. The collaboration part involved creating a "Digital Literacy Awareness Quiz" using Google Forms, covering various aspects such as password best practices.

The happy moment for me in this task was linking the Form to a Google Sheet. It really opened my eyes to how much time can be saved by using automation. In college, these tools can be lifesavers for group projects and research. HackerRank is great for keeping my logic skills sharp for future coding interviews, and Google Workspace makes being a student administratively much easier.

Task 4: Professional Communication & Etiquette :

Module 4 was all about the "soft skills" that are usually not taken into account in engineering. I was required to write two formal emails, one asking for an extension on the deadline and the other asking for a summer internship. This was good practice in making sure my subject headings were appropriate and my "call to action" was polite yet assertive.

I also created a Social Media Responsibility Checklist with five "Do's and Don'ts." This was probably the most enlightening task for me, as it made me realize just how permanent an action can be in cyberspace. I even "Googled" myself to see what comes up. I have learned that because text has no tone or body language, I have to be very careful in my wording to ensure my professional reputation is upheld.

Task 5: Cybercrime Awareness & Prevention :

The last task was a real in-depth look at cybercrimes such as Phishing and Identity Theft. I learned about a case study involving "spoof" emails that essentially trick college students into giving away sensitive information such as their log-in information and financial information. It is quite scary how a false sense of urgency can trick even a tech-savvy student into clicking on something malicious.

Because of this task, I have learned to be more careful when dealing with my emails. I now check the metadata of a sender before clicking anything. I also learned about various resources such as the 1930 National Helpline. This task really changed my outlook. I'm no longer a casual computer user; I'm now a bit more defensive about my online information.

Conclusion

In retrospect, this project has been a massive help in cleaning up my digital act. Before this project, my online presence was a bit of a mixed bag. I now have a cohesive professional story. I've learned that GitHub, Prezi, and Google Workspace are crucial tools. However, it is my understanding of "Digital Citizenship" that is going to make all the difference. I realize that as I delve deeper into my AIML studies, it is my learning about privacy, branding, and communication that is going to serve me well.
